Gradient
descent

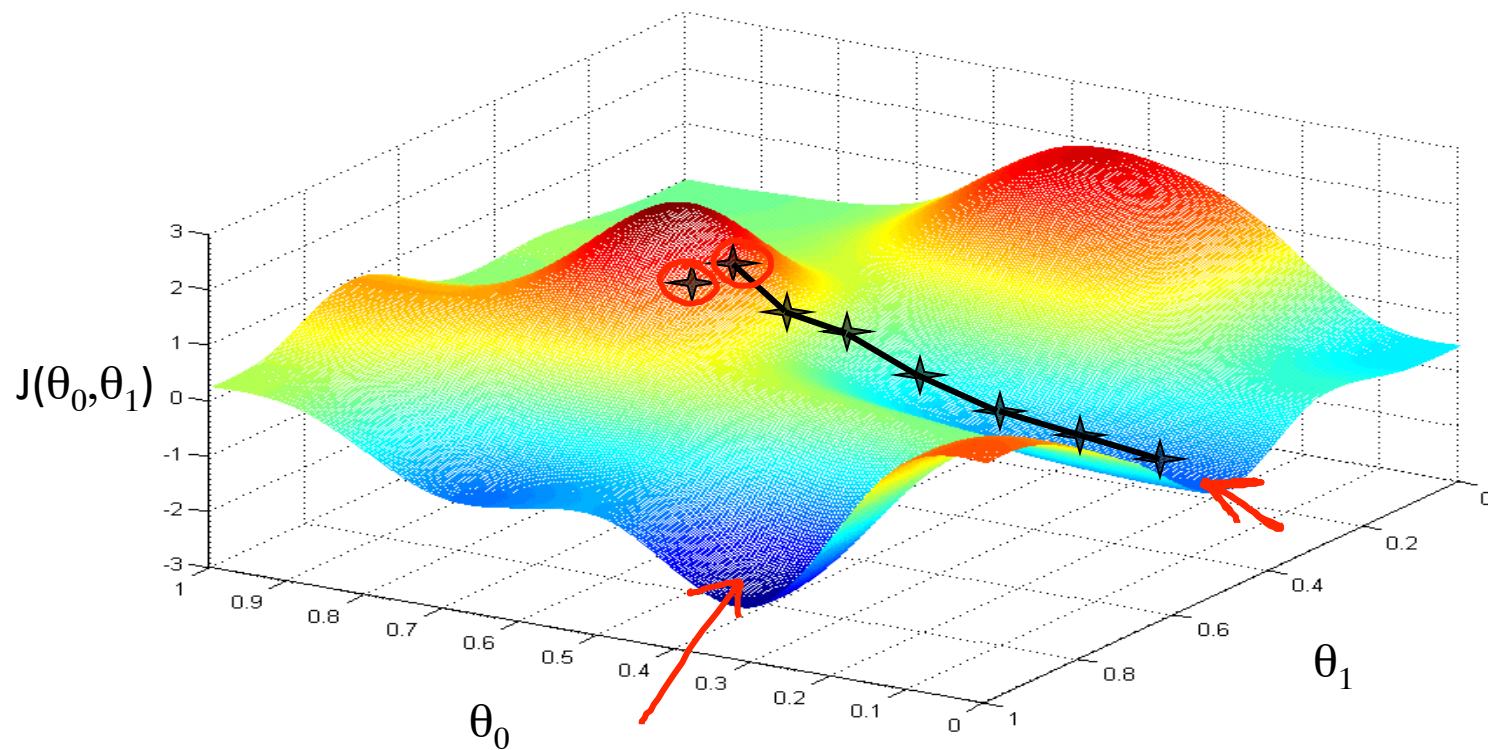

Have some function $\underline{J(\theta_0, \theta_1)}$ $J(\theta_0, \theta_1, \theta_2, \dots, \theta_n)$

Want $\min_{\theta_0, \theta_1} \underline{J(\theta_0, \theta_1)}$ $\min_{\theta_0, \dots, \theta_n} \underline{J(\theta_0, \dots, \theta_n)}$

Outline:

- Start with some $\underline{\theta_0, \theta_1}$ (say $\theta_0 = 0, \theta_1 = 0$)
- Keep changing $\underline{\theta_0, \theta_1}$ to reduce $\underline{J(\theta_0, \theta_1)}$
until we hopefully end up at a minimum

Gradient descent algorithm

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

learning rate

θ_0, θ_1

(for $j = 0$ and $j = 1$)

Simultaneously update
 θ_0 and θ_1

Assignment

$$a := b$$

$$a := a + 1$$

Truth assertion

$$a = b$$

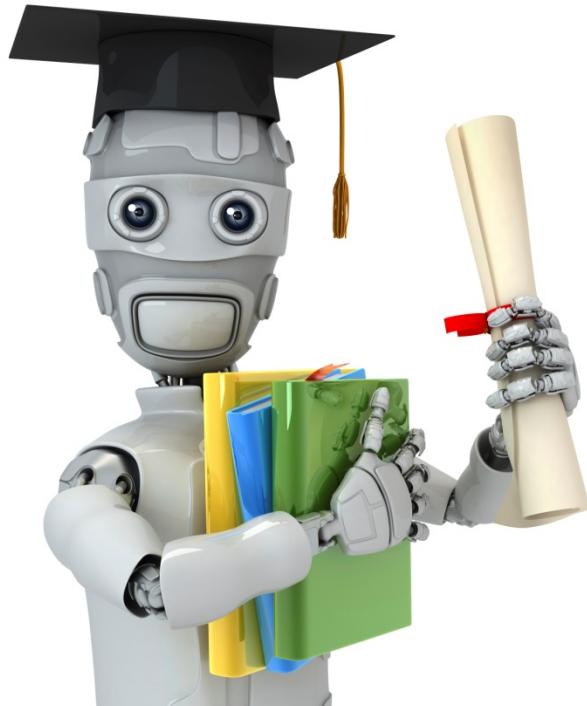

$$a = a + 1$$

Correct: Simultaneous update

- $\text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$
- $\text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$
- $\theta_0 := \text{temp0}$
- $\theta_1 := \text{temp1}$

Incorrect:

- $\text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$
- $\theta_0 := \text{temp0}$
- $\text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$
- $\theta_1 := \text{temp1}$

Gradient descent intuition

Gradient descent algorithm

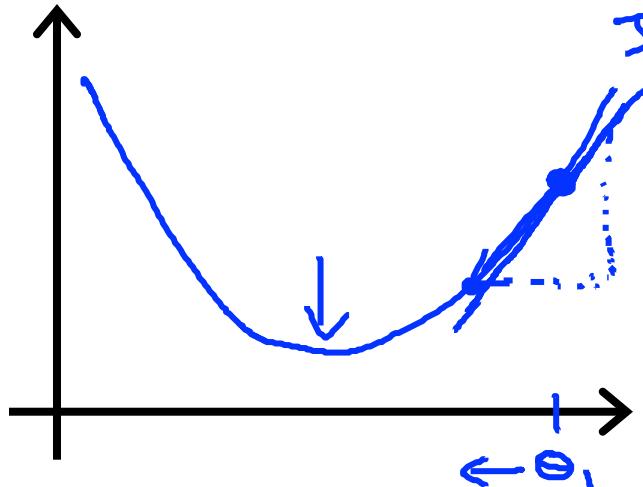

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

} learning rate derivative

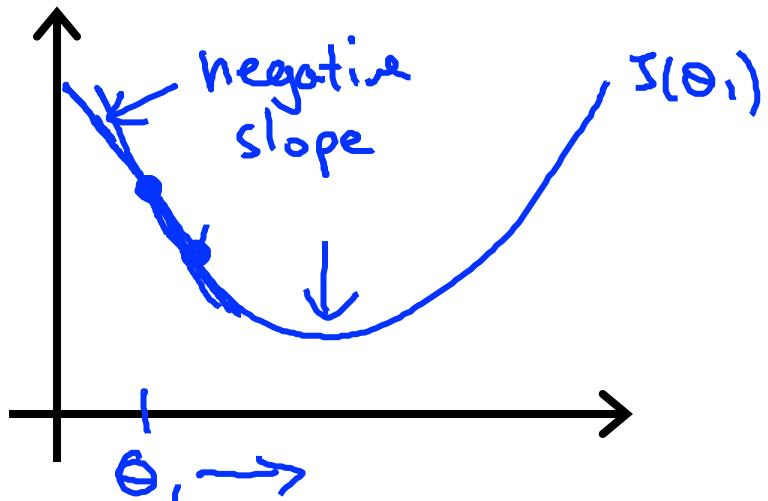

(simultaneously update
 $j = 0$ and $j = 1$)

$$\min_{\theta_1} J(\theta_1) \quad \theta_1 \in \mathbb{R}.$$

$J(\theta_1)$ ($\theta_1 \in \mathbb{R}$)

$$\theta_1 := \theta_1 - \frac{\alpha}{\frac{\partial}{\partial \theta_1} J(\theta_1)} \geq 0$$

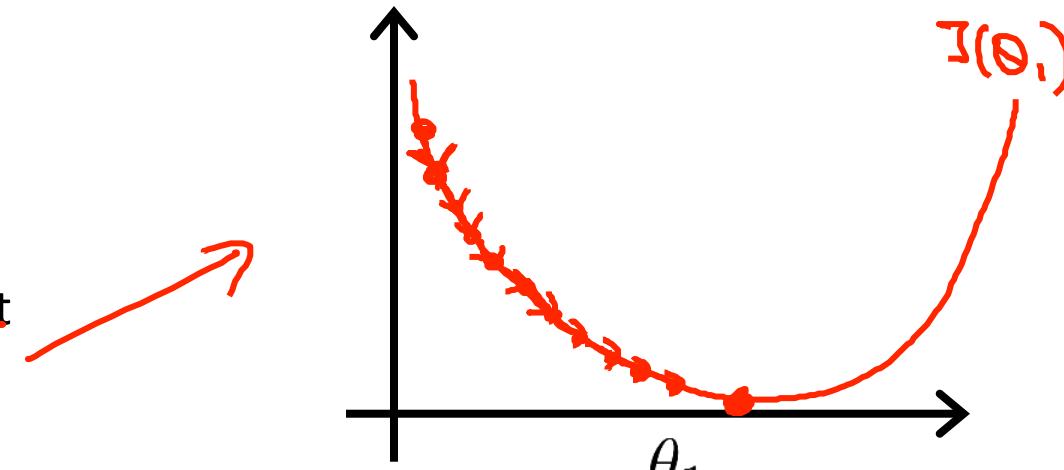

$\theta_1 := \theta_1 - \frac{\alpha}{\frac{\partial}{\partial \theta_1} J(\theta_1)}$ (positive number)

$$\frac{\frac{\partial}{\partial \theta_1} J(\theta_1)}{\leq 0}$$

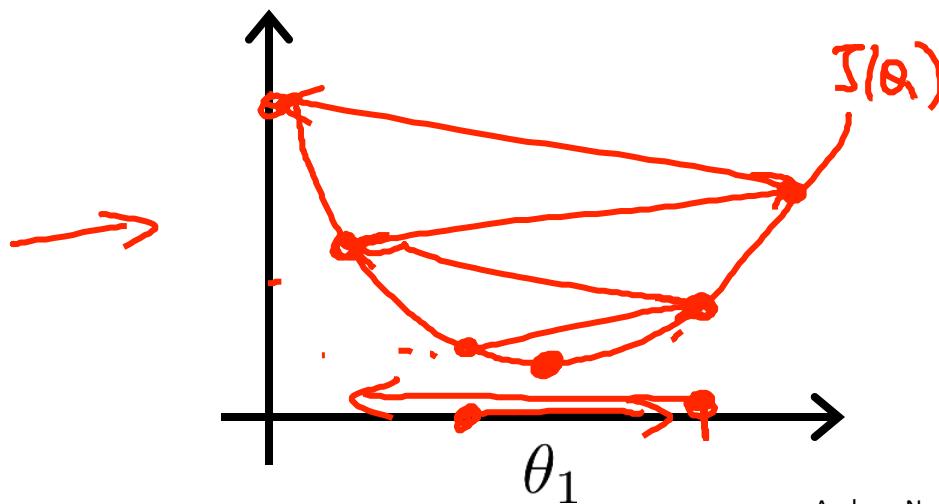

$\theta_1 := \theta_1 - \frac{\alpha}{\frac{\partial}{\partial \theta_1} J(\theta_1)}$ (negative number)

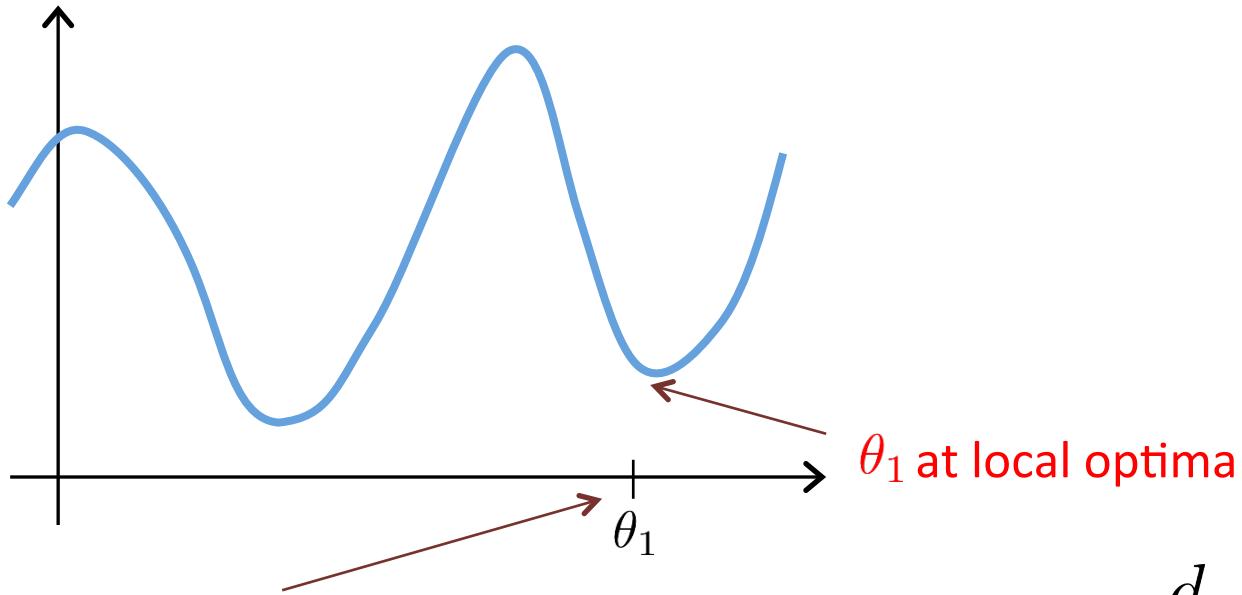

$$\theta_1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_1)$$

If α is too small, gradient descent can be slow.

If α is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

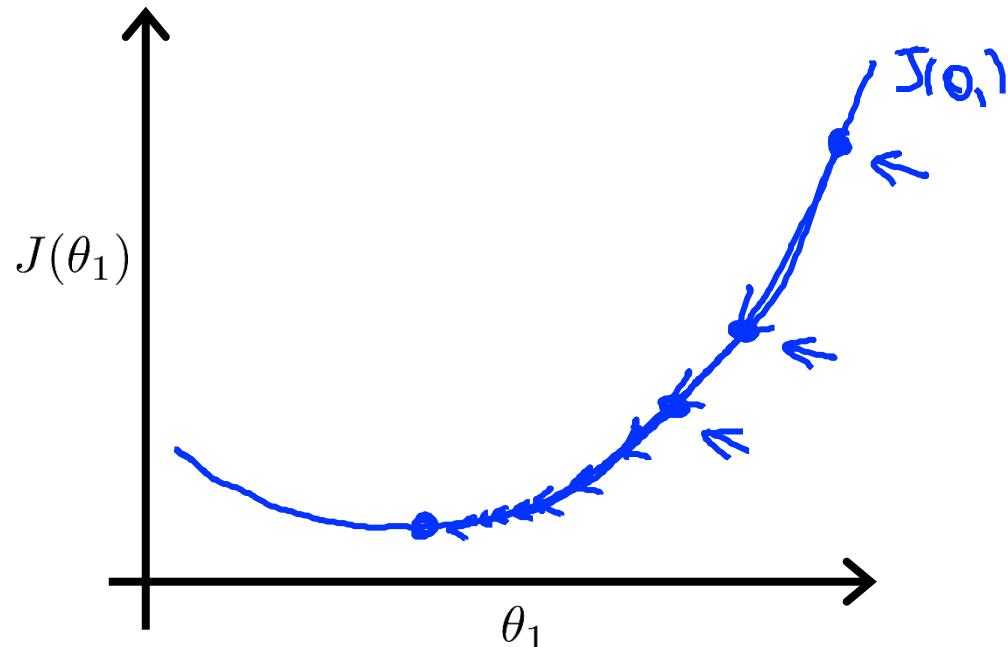

Current value of θ_1

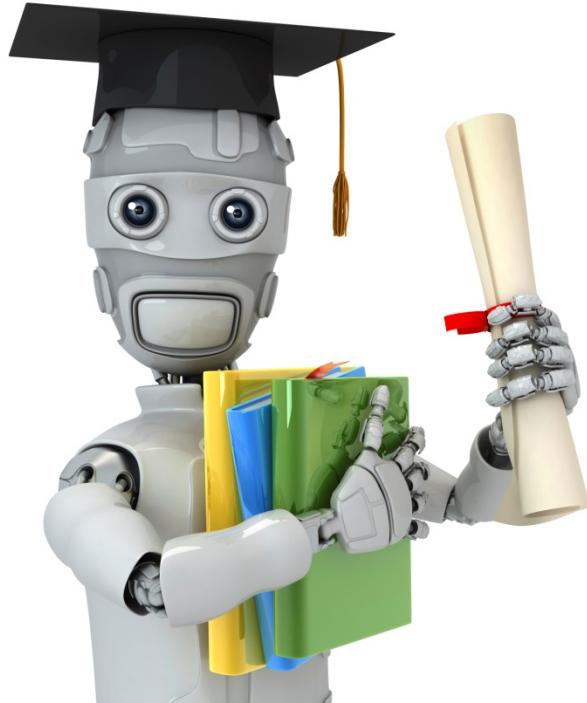

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

Gradient descent can converge to a local minimum, even with the learning rate α fixed.

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

As we approach a local minimum, gradient descent will automatically take smaller steps. So, no need to decrease α over time.
